Site is a type of storage area. Three functional areas were described: special storage, technical support/monitoring, and equipment storage/transportation.

The special storage area is made up of evenly spaced, staggered, earth-covered, mound-shaped, steel and concrete-buttressed bunkers. Each bunker is environmentally controlled and interconnected by curving tunnels. Glass viewing ports allow visual observation of bunker stocks. The tunnels are accessed through the support area building. This building is continuously manned; monitoring of stocks is a key activity.

Oblong/tapered, metallic cylindrical containing vessels, (possibly bombs/shells), are layed out on racks within the bunkers. Colors associated with these objects, (possibly identification markings), are grey, silver, black and white. Thick, acid, slightly rancid, burned, fetid smells are present.

There is an occasional (token) rotation of stocks. A lorry is employed to move stocks in and out of the site from the transportation area.

area is flat and sloping land. predominant colors are brown, green and blue. There is a clear smell overlayed by a thick smell. There is an alkaline taste here. noises are clash and also klick-klick. There are two types of structures here one appears to be a ~~anywhere~~ <sup>large</sup> angular structure. There is a second type which is low, the angular long and thick. area has an enclosed feeling to it. inside enclosed are is "man made" altered by man in some way. outside is more natural, more "green".

STRUCTURES have an underground portion which may be ~~anywhere~~ like. SITE has an arranged, laid out, planned feeling to it. SITE is occupied, lived in. There is a feeling of some kind of barracks (barrack cases) here. UNDERGROUND PORTION is ALWAYS OCCUPIED; AND IS USED FOR STORAGE. THERE ARE SHEDS ON TOP WHICH ARE USED FOR SURPLUS AND TRANSPORT OR EXCHANGE. THERE IS AN ADMINISTRATIVE OFFICE.
